

Release Notes

Overview

Date	March 2026
Version	2026.02.01
Previous	2025.11.02

What's New

Workspace

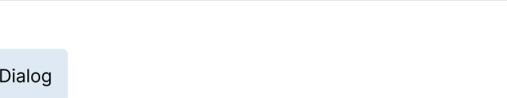

Tabs Redesign & Sidenav Updates

Sidenav Cleanup: Removed workspace tabs from the side navigation menu to streamline the layout.

Inline Tab Renaming: Implemented a quick-edit feature that allows users to rename any tab simply by double-clicking on it.

Relocated Delete Action: Moved the delete button directly onto each individual tab for more intuitive access.

Hover-State Visibility: Configured the tab delete button to appear only on mouse hover (matching the behavior seen in the QM module) to maintain a clean and uncluttered tab bar.

Place Order Dialog

Lite Version Implementation & UI Updates

New Features & Architecture:

Dual POD System: Introduced a two-tier system for the Place Order Dialog (POD) by keeping the existing version as "Advanced" and building a brand new "Lite" version.

User Preferences: Added a new setting in the user preferences allowing users to easily toggle their default view between the Lite and Advanced PODs.

Scope Limitation: The new Lite POD is currently implemented specifically for futures contracts.

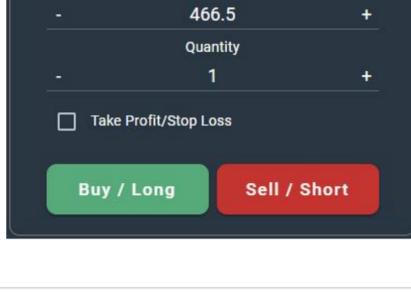

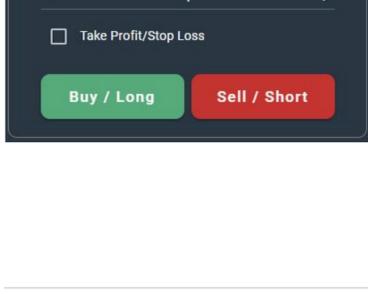

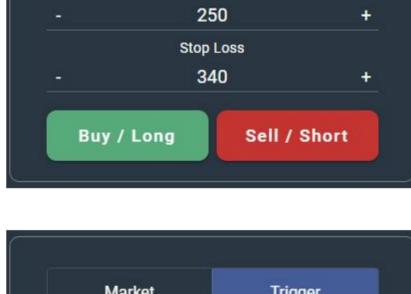

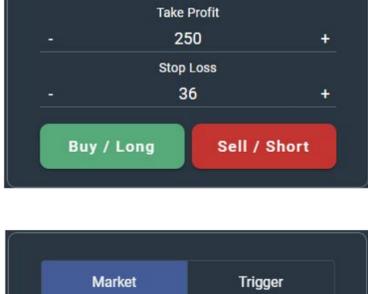

Lite POD Layout & Behavior:

Streamlined UI: Implemented a simplified, top-down component layout for faster order entry.

Symbol & Order Type: The symbol name is displayed at the top, followed by a toggle button for the Order Type (currently supporting only Market and Limit orders).

Dynamic Price Field: Implemented conditional rendering for the Price field set it is visible when a Limit order is selected and automatically hidden for Market orders.

Action Buttons: Added a clear Quantity input field followed by prominent Buy and Sell buttons at the bottom of the dialog.

Price Ladder Module

UI Redesign & Implementation Notes

Visual & Layout Changes:

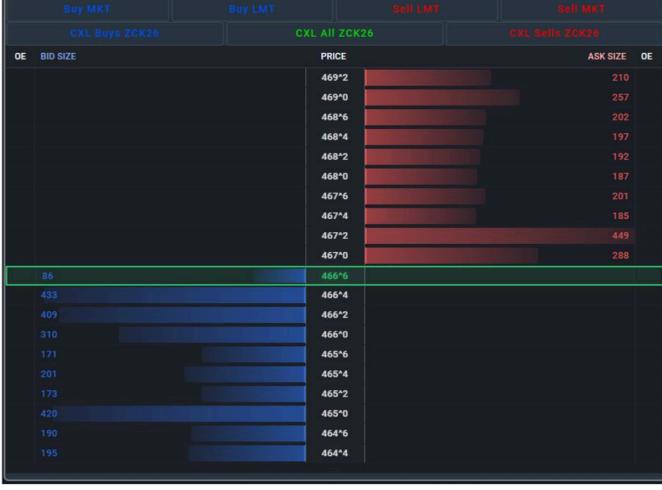

Updated the Layout: Implemented a new 5-column structure (OE, Bid Size, Price, Ask Size, OE) and set the default display mode to 'Condensed'.

Added Volume Bars: Replaced the old UI with horizontal volume bars in the 'Bid Size' and 'Ask Size' columns. The bar's width now dynamically represents its relative volume.

Center-Outward Alignment: Designed the volume bars to grow outward from the center (the Price column). In the 'Bid Size' column, the text is on the left and the bar is on the right; for 'Ask Size', it is perfectly mirrored.

Optimized OE (Order Entry) Columns: Narrowed the OE columns. Active orders are now visually displayed directly inside the OE cell at their respective price levels.

Market Price Highlight: The row corresponding to the 'at the market' price is now distinctly highlighted.

Options Chain

Updated Cell Typography & Layout: Redesigned the grid cells to display a dual-line format: a smaller, grey label on the top, and a larger, white text value on the bottom.

Updated 'Underlying' Display: Renamed the 'Underlying' label to 'Description'. The value now displays the full symbol name (e.g., 'E-mini S&P 500' instead of just 'SPY').

Merged Net Change Display: Combined the 'Net Change' and 'Net Change %' columns into a single, unified value. The UI now displays the monetary amount followed immediately by the percentage in parentheses.

Main Toolbar

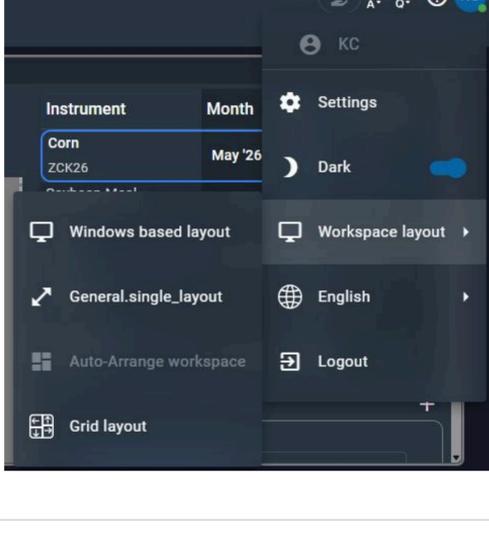

UI Updates: Main Toolbar & Menu Relocations

Removed the layout toggle buttons from the Main Toolbar.

Added a new 'Workspace layout' item to the Main Menu (positioned below 'Settings').

Implemented a hover submenu for 'Workspace layout' (featuring icon + text) with four options: Single mode, Grid, Auto-arrange, and Windows based.

Relocated the Theme Selector from the Main Toolbar to the Toolbar Menu, updating its UI to include an icon, a 'Dark theme' label, and a toggle button.

Charts

UI Updates: Quick Tool Properties Panel

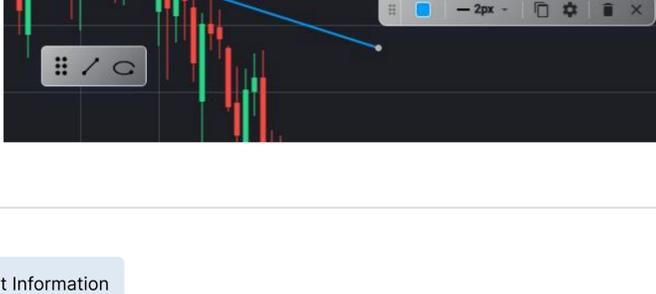

Implemented a new, floating "Tool Properties Panel" (visually similar to the favorite tools panel).

Added Triggers: The panel should appear automatically immediately after a tool is placed and/or whenever a tool is selected.

Added Drag-and-Drop: Users can freely move the panel around the workspace.

Dynamic Content: The panel will display only the most important, frequently used properties (e.g., line width, color, text). The displayed properties will update dynamically depending on the specific tool selected.

Updated Settings Navigation: Replaced the old "right-click → context menu" workflow. Users will now open the full properties/settings dialog via a dedicated button located directly inside this new panel.
